

Backup and Restore database in MySQL server

❖ Backup Database

- Process of creating a duplicate copy of a database, including its structure (such as tables, indexes, and constraints) and its data, for the purpose of safeguarding against data loss or corruption.
- To back up your MySQL database, you can use the 'mysqldump' command.

mysqldump -u username -p database_name > backup_file.sql

Example:

mysqldump -u root -p mydatabase > mybackup.sql

Steps:

1. Open MySQL Command Line
2. Select Database

If you're not already using the database you want to backup, select the database.

USE your_database_name;

3. Backup Command

The 'mysqldump' command is used to back up the database.

mysqldump -u your_username -p your_database_name > backup_file.sql

4. Verify Backup

After the backup, check the directory where you stored the backup file to ensure it's there and has the data you need.

❖ Restore Database

- To restore a MySQL database from a backup file, you can use the **mysql** command.
- This command reads SQL statements from a file and executes them in the specified database.

mysql -u username -p database_name < backup_file.sql

Example:

mysql -u root -p mydatabase < mybackup.sql

Steps:

1. Open MySQL Command Line
2. Create Empty Database

If you don't already have an empty database to restore to, create one database

CREATE DATABASE your_database_name;

3. Restore Command

Use the below command to restore your database from the backup file.

mysql -u your_username -p your_database_name < backup_file.sql

4. Verify Restore

After the restore process completes, check your database to ensure that the data has been successfully restored.
