Installing and testing XAMPP for MySQL

XAMPP Server

- XAMPP is a free and open-source cross-platform package that provides a local web server environment for testing and development.
 - It stands for:
 - X - Cross-Platform
 - A - Apache
 - M - MySQL (or MariaDB)
 - P - PHP
 - P - Perl
 - Download link:- <https://www.apachefriends.org/download.html>
-

Starting and Testing XAMPP Server

- Once the XAMPP server has been successfully installed, we can now launch and start working on it.

1. Step 1: Access the XAMPP Control Panel shortcut from the Windows search.
2. Step 2: Start the MySQL Services.
3. Step 3: Click the “shell” (CMD) icon to open the MySQL console.
4. Step 4: Enter the command to connect to MySQL sever from command prompt.

```
mysql -u root -p
```

5. Step 5: At the prompt for password, just press enter key.
 - ✓ Now you are at the MySQL Console and may enter MySQL commands/queries.
 6. Step 6: You can disconnect from MySQL database any time using **exit** or **quit** command at mysql> prompt or press **ctrl+c**.
 7. Step 7: Then click “**Quit**” button in the XAMPP server control panel for the proper shutdown.
-

Basic Queries

Basic Queries

- Once logged in, you can try some simple queries
 - For example:
 - `SELECT VERSION() , CURRENT_DATE;`
 - Note that most MySQL commands end with a semicolon (;)
 - MySQL returns the *total number of rows* found, and the *total time to execute* the query.
 - Keywords may be entered in any letter case.
 - The following queries are equivalent:
 - `SELECT VERSION() , CURRENT_DATE;`
 - `select version() , current_date;`
 - `SeLeCtVeRsIoN() , current_DATE;`
-

Basic Queries Cont...

- Here's another query. It demonstrates that you can use mysql as a simple calculator:
 - `SELECT SIN(PI()/4), (4+1)*5;`
 - You can also enter multiple statements on a single line. Just end each one with a semicolon:
 - `SELECT VERSION(); SELECT NOW();`
-

Multi-Line Commands

- MySQL determines where your statement ends by looking for the terminating semicolon, not by looking for the end of the input line.
- Here's a simple multiple-line statement:

```
SELECT
```

```
USER ()
```

```
,
```

```
CURRENT_DATE ;
```

Canceling a Command

- If you decide you don't want to execute a command that you are in the process of entering, cancel it by typing \c

SELECT

USER ()

\c

- The following table shows each of the prompts you may see and summarizes what they mean about the state that MySQL is in.

Prompt	Meaning
mysql>	Ready for new query
->	Waiting for next line of multiple-line query
'>	Waiting for next line, waiting for completion of a string that began with a single quote (')
">	Waiting for next line, waiting for completion of a string that began with a double quote (")
`>	Waiting for next line, waiting for completion of an identifier that began with a backtick (`)
/*>	Waiting for next line, waiting for completion of a comment that began with /*
